ACKNOWLEDGMENT

5

This publication is a result of joint efforts by ministries, competent authorities, research institutions, NGOs and experts from EU accession economies in the SEE region to develop a regionally adapted fundamental database for planning, design and development of information systems for nature conservation / biodiversity. This endeavour, which involved pooling of expertise from the SEE region as well as from Croatia, was pursued with determination and in the spirit of excellent cooperation at all levels: political, technical and administrative. All parties and persons involved are greatly acknowledged for their contribution to this work.

INTRODUCTION

7

Establishment of the fundamental database for the Information System for Nature Conservation/Biodiversity (ISNC) was supported by the **Open Regional Fund for South-East Europe – Biodiversity (GIZ/ORF-BD)** as part of its sub-project “*Regional Network for Biodiversity Information Management and Reporting (BIMR)*”, funded by the **German Federal Ministry for Economic Cooperation and Development (BMZ)** and implemented by **Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) GmbH**.

Objective of the BIMR sub-project is to improve BIMR capacities in partner institutions in South-East Europe (SEE) which are needed to meet the requirements of the Convention on Biological Diversity (CBD) and European Union (EU).

The challenges are addressed by ensuring participation and engagement of all relevant stakeholder groups within the SEE region in the design and implementation of three capacity-building components in the BIMR sub-project:

Component 1: Regional and National Assessments of the BIMR Baseline (Stakeholder Assessment, Policy Set-up Assessment and Information System Set-up Assessment)

Component 2: BIMR Regional Guidelines and Recommendation Paper on Enhancing BIMR in the SEE region

Component 3: Piloting of BIMR Regional Guidelines

- **Activity 1:** Development of the List of Selected Endemic Terrestrial Plant and Animal Taxa of SEE,
- **Activity 2:** Establishment of the fundamental database for ISNC in three economies - Montenegro, Macedonia and Bosnia and Herzegovina (separately for Republika Srpska and Federation of Bosnia and Herzegovina).

The BIMR sub-project also delivered two trainings to the relevant stakeholders from the SEE region:

- GIS training “Data processing and handling techniques for the purposes of efficient biodiversity data management and reporting”,
- First Biodiversity Data Mobilization training in cooperation with the Global Biodiversity Information Facility (GBIF).

One of the attempts to successfully contribute to the establishment of the ISNC fundamental database in these three economies has commenced as part of the SP BIMR Component 3 (Activity 1), together with this publication. It was based on results and recommendations from Component 1 and 2, scaled up from existing regional projects and initiatives as well as European and global standards. This publication describes the process of establishing the ISNC (objective, methodology, and design of software components with simplified diagram modules, database summary and detailed tables) and relies on the consultations with and contributions from key stakeholders in the period from November 2017 to July 2018. The focus of the approach was on findings of high relevance, adding value to the related ongoing and future initiatives. Subsequent collaborative and coordinated efforts are needed for further establishment and development of ISNC modules.

OBJECTIVE AND METHODOLOGY

The objective of the fundamental database for ISNC is to provide a common platform for managing and regional sharing of biodiversity data, knowledge and experience, in line with the technical and organizational / administrative differences that exist between the economies. This IT solution supports several groups of users, such as: (i) administrative bodies/ decision makers; (ii) biodiversity professionals; and (iii) general public, and is focused on several globally accepted technical standards and implementation strategies:

- A well-defined, integrated biodiversity database with a fully documented structure (entity-relationship diagrams),
- Definition and partial implementation of the middleware software layer (WEB services), which provides several benefits:
 - High level of data protection by abstraction of the database structure and software modules,
 - Flexibility in selection of end-user software solution(s) and platforms (commercial or open source),
 - Open standards platform for independent future software development (other WEB modules, desktop solutions, mobile solutions, etc.),
- Fully functional web site(s) that demonstrate the functionality of the proposed solution. These web site(s) are economy-dependent, utilizing local ICT conditions, priorities and resources.

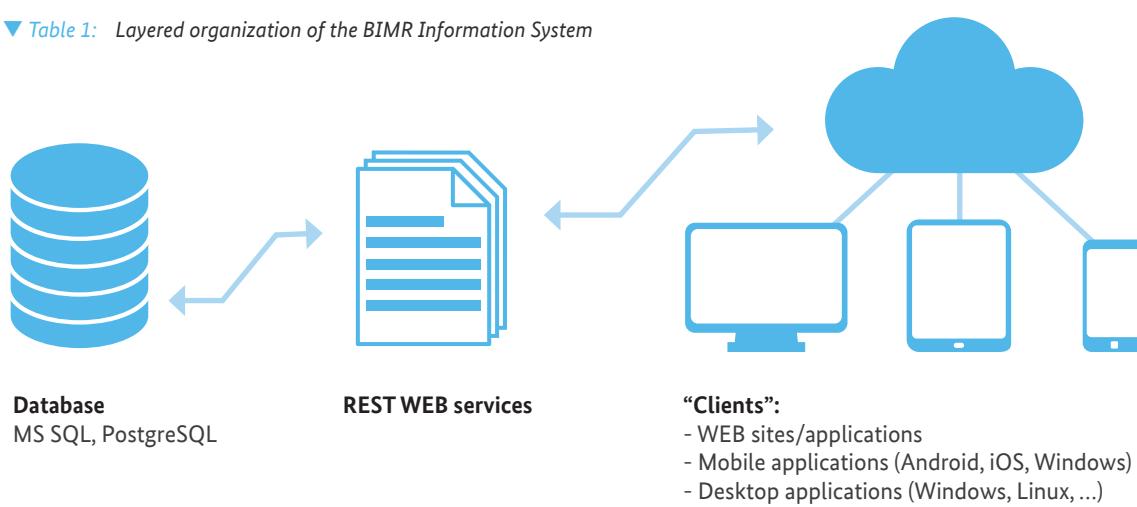

As part of this activity, the Expert Team identified all attributes, capabilities and characteristics, i.e. expected and economy-specific qualities of a system for managing different types of biodiversity data. In preparing and suggesting the IT solution, careful consideration was given to previously recognized weaknesses and key gaps in all three economies:

- **Technical capacities**, including standards and systems for data collection, data verification and validation, data analysis and reporting,
- **Institutional set-up and human resources**, previous experiences, lessons learned and already implemented solutions.

To gain full understanding of the stakeholders' intentions and needs, at the very start of this activity the Expert Team made iterative and recursive steps in parallel with other activities aimed at defining the **general performance of the system, including the necessary capabilities of the operators and other stakeholders who will use the system**.

An overview of functionalities and options, accepted by specific stakeholders, was used to prepare a conceptual schema of the IT architecture and organizational requirements, **i.e. explanation of relations to the environment and the construction principles that were used in the design of software components (database, WEB services and WEB site)** as shown in Table 1.

▼ *Table 1: Layered organization of the BIMR Information System*

DESIGN OF SOFTWARE COMPONENTS

9

The developed IT solution has the same structure and shares the same database structure in all economies. The following software components were built during the implementation of this solution, with specifics described below:

Database design

This is the essential element of the BIMR Information System. Besides the differences between economies in terms of institutional background, available biodiversity-related IT solutions and databases and IT technologies in use, the biodiversity data model was identical and common for all economies. The developed biodiversity database entity-relationship diagram was at the economy level and IT-platform-independent. Also, the designed structure covered all biodiversity areas, not only segments (WEB sites) that were implemented within the framework of this activity.

The biodiversity database is logically organized in 6 modules - database schemas (Annex 1):

- **General schema**, including tables related to administrative units, localities, responsible persons per biodiversity area / institution;
- **Bibliography schema**, including tables for all types of textual (books, publications, articles, etc.) and multimedia (videos, internet channels and links, etc.) lookup tables;
- **References schema**, including tables that are used by all other schemas, such as: species list, habitats list, different classifications, etc.;
- **Surveys schema**, including tables for organizing data for field and desktop research;
- **Protected areas schema**, including all data relevant for protected areas. Tables are optimized to support all types of protected areas;
- **Geographic Information System (GIS) schema**, including all relevant spatial data that can be referenced by any other table in other schemas.

The database summary, with a list of all tables in all modules/schemas is provided in Annex 2, while detailed table definitions are provided in Annex 3.

There are many benefits to this approach:

a. Biodiversity expert area

- i. Organization of biodiversity data in a unified database structure at both national and regional level;
- ii. Standardized manipulation and reporting of biodiversity data at the national level;
- iii. Support for easy biodiversity data sharing at the regional level;
- iv. Increased possibility for best practices and experiences at the regional level.

b. Technical expert area

- i. Relational Database Management System (RDBMS) that can utilize the developed database structure without any technical limitations (commercial or open source RDBMS, existing or new implementations);
- ii. Hardware platform independent;
- iii. Operating system independent (Windows, Linux, ...);
- iv. Straightforward further development of database and software solutions.

WEB services

This IT layer is defined and built using market-recognized standards and frameworks: REST WEB services built on top of the Microsoft Foundation Communication (MFC) framework and Microsoft Entity Framework. This approach provides:

- a. Separation of business logic from the database and Graphical User Interface (GUI);
- b. Good database integrity protection;

- c. Straightforward further development of other software modules (“clients”) that will use the biodiversity database without interrupting previously developed software;
- d. Independence of development platform in client software development (Windows, Linux, Android, iOS, open source ...).

WEB site(s)

Web sites developed as part of this activity were at the economy level regarding content and IT platform specific:

- a. **Macedonia** implemented a web site for Natura 2000 Standard Data Form – SDF, including reporting data requirements. The following IT technologies were used:
 - 1. RDBMS: Microsoft SQL Server
 - 2. WEB services: Microsoft Foundation Communication with Microsoft Entity Framework
 - 3. WEB site: owned by the Ministry of Environment and Physical Planning
- b. Other economies developed web sites for data import from the List of Selected Endemic Terrestrial Plant and Animal Taxa of SEE (compiled data: taxa and occurrences), based on the Darwin Core standard:
 - i. Montenegro
 - 1. RDBMS: Microsoft SQL Server
 - 2. WEB services: Microsoft Foundation Communication with Microsoft Entity Framework
 - 3. WEB site: owned by the Agency for Nature and Environmental Protection
 - ii. Bosnia and Herzegovina

Federation of Bosnia and Herzegovina:

 - 1. RDBMS: Microsoft SQL Server
 - 2. WEB services: Microsoft Foundation Communication with Microsoft Entity Framework
 - 3. WEB site: owned by the Environmental Fund of the FBiH

Republika Srpska

 - 1. RDBMS: PostgreSQL Server – Open source
 - 2. WEB services: Django (high-level Python Web framework) – Open source
 - 3. WEB site: owned by the Republic Institute for Protection of Cultural – Historical and Natural Heritage of Republika Srpska
